 - ▶ DELETE
- ▶ Mostly unknown
 - ▶ HEAD
 - ▶ OPTIONS
 - ▶ TRACE
 - ▶ CONNECT
- ▶ WebDAV
 - ▶ MKCOL
 - ▶ PROPSET
 - ▶ PROPGET
- ▶ Use any you want...

“Safe” HTTP methods

[..] GET and HEAD methods SHOULD NOT have the significance of taking an action other than retrieval. [RF99]

“Safe” HTTP methods

[..] GET and HEAD methods SHOULD NOT have the significance of taking an action other than retrieval. [RF99]

- ▶ ... so it is *safe* for spiders to call them.

“Safe” HTTP methods

[..] GET and HEAD methods SHOULD NOT have the significance of taking an action other than retrieval. [RF99]

- ▶ ... so it is *safe* for spiders to call them.
- ▶ Since nothing is modified, the result can be cached.
 - ▶ Proxies can use that automatically
 - ▶ Varnish / Squid
 - ▶ Company application proxies

“Safe” HTTP methods

[..] GET and HEAD methods SHOULD NOT have the significance of taking an action other than retrieval. [RF99]

- ▶ ... so it is *safe* for spiders to call them.

Is your search form broken?

```
1 <form action="/search" method="POST">
2   <input type="text" name="term" />
3   <input type="submit" value="Search!" />
4 </form>
```

Is your search form broken?

```
1 <form action="/search" method="POST">
2   <input type="text" name="term" />
3   <input type="submit" value="Search!" />
4 </form>
```

- ▶ Broken semantics
 - ▶ Search results may not be cached

Is your search form broken?

```
1 <form action="/search" method="POST">
2   <input type="text" name="term" />
3   <input type="submit" value="Search!" />
4 </form>
```

- ▶ Broken semantics
 - ▶ Search results may not be cached
- ▶ No bookmarking of search results

POST vs. PUT

POST vs. PUT

- ▶ POST

- ▶ PUT

POST vs. PUT

- ▶ POST

- ▶ *... is used to request that the origin server accept the entity enclosed in the request as a **new subordinate** ... [RF99]*

- ▶ PUT

POST vs. PUT

- ▶ POST

- ▶ *... is used to request that the origin server accept the entity enclosed in the request as a **new subordinate** ... [RF99]*
- ▶ Appends to an existing resource!
 - ▶ e.g. an existing collection of documents

- ▶ PUT

POST vs. PUT

- ▶ POST

- ▶ *... is used to request that the origin server accept the entity enclosed in the request as a **new subordinate** ... [RF99]*
- ▶ Appends to an existing resource!
 - ▶ e.g. an existing collection of documents
- ▶ Examples
 - ▶ Posting a message to a bulletin board
 - ▶ Extending a database through an append operation

- ▶ PUT

POST vs. PUT

▶ POST

- ▶ *... is used to request that the origin server accept the entity enclosed in the request as a **new subordinate** ... [RF99]*
- ▶ Appends to an existing resource!
 - ▶ e.g. an existing collection of documents
- ▶ Examples
 - ▶ Posting a message to a bulletin board
 - ▶ Extending a database through an append operation

▶ PUT

- ▶ *... requests that the enclosed entity be stored under the supplied Request-URI. [RF99]*

POST vs. PUT

▶ POST

- ▶ *... is used to request that the origin server accept the entity enclosed in the request as a **new subordinate** ... [RF99]*
- ▶ Appends to an existing resource!
 - ▶ e.g. an existing collection of documents
- ▶ Examples
 - ▶ Posting a message to a bulletin board
 - ▶ Extending a database through an append operation

▶ PUT

- ▶ *... requests that the enclosed entity be stored under the supplied Request-URI. [RF99]*
- ▶ Creates or replaces a resource!

POST vs. PUT

▶ POST

- ▶ *... is used to request that the origin server accept the entity enclosed in the request as a **new subordinate** ... [RF99]*
- ▶ Appends to an existing resource!
 - ▶ e.g. an existing collection of documents
- ▶ Examples
 - ▶ Posting a message to a bulletin board
 - ▶ Extending a database through an append operation

▶ PUT

- ▶ *... requests that the enclosed entity be stored under the supplied Request-URI. [RF99]*
- ▶ Creates or replaces a resource!
- ▶ Examples
 - ▶ Updating account data using (PUT /users/42)
 - ▶ Create a new resource with known identifier

HTML 5 is broken!

Using PUT and DELETE as HTTP methods for the form element is no longer supported. [vK10]

Idempotent methods

$$f(x) = f(f(x))$$

Idempotent methods

$$f(x) = f(f(x))$$

- ▶ Everything but POST has to be idempotent
 - ▶ Executing the request again, should not change anything.

Idempotent methods

$$f(x) = f(f(x))$$

- ▶ Everything but POST has to be idempotent
 - ▶ Executing the request again, should not change anything.
 - ▶ This includes PUT and DELETE

Idempotent methods

$$f(x) = f(f(x))$$

- ▶ Everything but POST has to be idempotent
 - ▶ Executing the request again, should not change anything.
 - ▶ This includes PUT and DELETE
- ▶ Really useful to just resend request, if one failed due to network problems

Idempotent methods

$$f(x) = f(f(x))$$

- ▶ Everything but POST has to be idempotent
 - ▶ Executing the request again, should not change anything.
 - ▶ This includes PUT and DELETE
- ▶ Really useful to just resend request, if one failed due to network problems
- ▶ Idempotence is a useful property in all messaging systems

HTTP method fail in PHP

- ▶ `$_GET` contains the request parameters
- ▶ `$_POST` contains the request body

HTTP method fail in PHP

- ▶ `$_GET` contains the request parameters
- ▶ `$_POST` contains the request body
- ▶ All HTTP requests may contain body **and** parameters

HTTP method fail in PHP

- ▶ `$_GET` contains the request parameters
- ▶ `$_POST` contains the request body
- ▶ All HTTP requests may contain body **and** parameters
 - ▶ Yes, even GET!

HTTP method fail in PHP

- ▶ `$_GET` contains the request parameters
- ▶ `$_POST` contains the request body
- ▶ All HTTP requests may contain body **and** parameters
 - ▶ Yes, even GET!
- ▶ You may want to use something like
 - ▶ `$request->parameters`
 - ▶ `$request->body`

Do you speak HTTP?

- ▶ GET and HEAD **must** be supported

Do you speak HTTP?

- ▶ GET and HEAD **must** be supported
- ▶ All other methods are **optional**

Do you speak HTTP?

- ▶ GET and HEAD **must** be supported
- ▶ All other methods are **optional**
- ▶ But if you implement them, they must obey to semantics

Do you speak HTTP?

- ▶ GET and HEAD **must** be supported
- ▶ All other methods are **optional**
- ▶ But if you implement them, they must obey to semantics
- ▶ Sorry, your website is not HTTP, if you ...
 - ▶ ...are using POST for a search form.
 - ▶ ...are using POST for data updates.

Outline

HTTP

Layered architecture

Request semantics

Stateless server

Code on demand

Stateless server

- ▶ No persistent connection
- ▶ Each request contains all information to be processed

Stateless server

- ▶ No persistent connection
- ▶ Each request contains all information to be processed
 - ▶ Cookies

Stateless server

- ▶ No persistent connection
- ▶ Each request contains all information to be processed
 - ▶ Cookies
- ▶ Servers can be exchanged transparently

Stateless server

- ▶ No persistent connection
- ▶ Each request contains all information to be processed
 - ▶ Cookies
- ▶ Servers can be exchanged transparently
 - ▶ Mind the sessions and static data

Code on demand

Do you?

In the code-on-demand style, a client component . . . receives that code, and executes it locally. [Fie00]

Do you?

In the code-on-demand style, a client component . . . receives that code, and executes it locally. [Fie00]

- ▶ Do you deliver code on demand?

Do you?

In the code-on-demand style, a client component . . . receives that code, and executes it locally. [Fie00]

- ▶ Do you deliver code on demand?
- ▶ You do!

Do you?

In the code-on-demand style, a client component . . . receives that code, and executes it locally. [Fie00]

- ▶ Do you deliver code on demand?
- ▶ You do!
 - ▶ JavaScript

Do you?

In the code-on-demand style, a client component . . . receives that code, and executes it locally. [Fie00]

- ▶ Do you deliver code on demand?
- ▶ You do!
 - ▶ JavaScript
 - ▶ HTML is also just code
although not turing complete

 - ▶ HTML is also just code
 - although not turing complete
- ▶ Layered **Code on Demand Client** Cached Stateless Server

Code generation is the root cause for web application security problems.

Code generation is the root cause for web application security problems.

- ▶ Escape for target context / language (XSS)

Outline

Introduction

HTTP

Taking it further

Conclusion

Embrace HTTP

Embrace HTTP

Use HTTP actively

- ▶ Semantic HTTP methods
- ▶ URIs (address resources)
- ▶ Status codes
- ▶ Headers
 - ▶ Cache control
 - ▶ Content negotiation
 - ▶ ...

What about REST?

- ▶ What is REST actually?

What about REST?

- ▶ What is REST actually?
 - ▶ “New” style web services

What about REST?

- ▶ What is REST actually?
 - ▶ “New” style web services
 - ▶ Follow HTTP / LCoDC\$SS
 - ▶ Follow resources / concept character of URIs
 - ▶ Use proper status codes

What about REST?

- ▶ What is REST actually?
 - ▶ “New” style web services
 - ▶ Follow HTTP / LCoDC\$SS
 - ▶ Follow resources / concept character of URIs
 - ▶ Use proper status codes
 - ▶ **HATEOAS**

What about REST?

- ▶ What is REST actually?
 - ▶ “New” style web services
 - ▶ Follow HTTP / LCoDC\$SS
 - ▶ Follow resources / concept character of URIs
 - ▶ Use proper status codes
 - ▶ **HATEOAS**
 - ▶ Hypermedia as the Engine of Application State [Fie00]

What about REST?

- ▶ What is REST actually?
 - ▶ “New” style web services
 - ▶ Follow HTTP / LCoDC\$SS
 - ▶ Follow resources / concept character of URIs
 - ▶ Use proper status codes
 - ▶ **HATEOAS**
 - ▶ Hypermedia as the Engine of Application State [Fie00]
 - ▶ Short: Use hyper links to delegate client
